

	Sudoku	Hamiltonian Cycle	Discrete Log (variant)	Discrete Log (Schnorr variant)
<p>Statement</p> <p>public or sent from P to V</p>	Partial sudoku Ψ is solvable	Graph G is Hamiltonian ¹	Let \mathbb{G} of order q and $y \in \mathbb{Z}_q$ be fixed.	Let \mathbb{G} of order q and $y \in \mathbb{G}$ be fixed.
<p>Witness</p> <p>only known to P</p>	Solution $\overline{\Psi}$	Hamiltonian cycle v	x	x
Iteration				
<p>1. Rerandomization by P of</p> <p>1. Problem Statement</p> <p>2. Solution</p>	<p>Pick set isomorphism i on $\{1, \dots, 9\}$</p> <p>1. $\Psi' := i[\Psi]$ is solvable</p> <p>2. $\overline{\Psi'} := i[\overline{\Psi}]$ is solution to Ψ'</p>	<p>Pick graph isomorphism $i \colon G \rightarrow G'$ (just relabel vertices)</p> <p>1. $G' := i[G]$ is Hamiltonian</p> <p>2. $v' := i[v]$ is Hamiltonian cycle for G'^2</p>	Pick $r \leftarrow \mathbb{Z}_q$ uniformly at random	Pick $r \leftarrow \mathbb{Z}_q$ uniformly at random
2. Commitment by P	<p>Send all of</p> <ul style="list-style-type: none"> $(\text{com}(\Psi_{i,j}))_{i,j}$ $\text{com}(\Psi')$ 	<p>Send all of</p> <ul style="list-style-type: none"> G' $\text{com}(i)$ $\text{com}(v')$ 	<p>Send all of</p> <ul style="list-style-type: none"> $\hat{g} := [r]$ $\text{com}(r)$ 	Send $[r]$
3. Pose Challenge by V	<p>Ask for one of</p> <ul style="list-style-type: none"> permuted row i permuted column j permuted square k permuted statement <p>In total, this gives $9 + 9 + 9 + 1 = 28$ challenge types</p>	<p>Ask for one of</p> <ul style="list-style-type: none"> isomorphism $i \colon G \rightarrow G'$ Hamiltonian cycle in G' 	<p>Ask for one of</p> <ul style="list-style-type: none"> r $x + r$ <p>and denote response by resp.</p>	<p>Pick $c \leftarrow \mathbb{Z}_q$ uniformly at random.</p> <p>Ask for $cx + r$ and denote response by resp.</p>
4. Respond to challenge by P	canonical: respond exactly with what was required			
5. Verify response by V	<p>Check</p> <ul style="list-style-type: none"> that no numbers occur twice in row, column, or square, or that the permuted statement is in fact a permutation 	<p>Check</p> <ul style="list-style-type: none"> conditions on isomorphism, or check that cycle is indeed Hamiltonian 	<p>Check</p> <ul style="list-style-type: none"> that indeed $\hat{g} = [\text{resp.}]$ that $[\text{resp.}] = y + \hat{g}$ namely if indeed $[x] = y$, then $y + \hat{g} = [x] + [r] = [x + r] = [\text{resp.}]$ 	Check that $[\text{resp.}] = cy + [r]$
<p>Completeness</p> <p>P can convince V in case P actually had a solution</p>	Since step 4 above is canonical, provers can convince with prob. of 1			
<p>Soundness</p> <p>P cannot convince V without having a solution</p>	Probability of convincing w/o sol. is	Probability of convincing w/o sol. is	Probability of convincing w/o sol. is	todo
	$\approx \left(\frac{1}{28}\right)^{\#\text{iter}}$	$\left(\frac{1}{2}\right)^{\#\text{iter}}$	$\left(\frac{1}{2}\right)^{\#\text{iter}}$	
<p>Zero Knowledge</p> <p>V doesn't learn anything about the witness</p>	todo	In each round, V learns <i>either</i> a useless isomorphism <i>or</i> a Hamiltonian cycle in $G' \cong G$. Since the graph isomorphism problem is believed to be hard, learning about such a cycle in G' without learning the isomorphism is useless as well.	In each round, V learns <i>either</i> a useless random r <i>or</i> $x + r$. In the latter case, however, since $r \sim \mathcal{U}(\mathbb{Z}_q)$, we also have $(x + r) \sim \mathcal{U}(\mathbb{Z}_q)^3$	In each round, V only learns $[r]$ and $cx + r$ for a c chosen by them. Due to DLOG assumed to be hard in \mathbb{G} , in the eyes of V we have $r \sim \mathcal{U}(\mathbb{Z}_q)$ and hence $(cx + r) \sim \mathcal{U}(\mathbb{Z}_q)^3$.

¹ This means it contains a so-called Hamiltonian cycle that is a path visiting every node exactly once.

² Here, v is effectively a sequence of edges, on which the isomorphism is applied elementwise.

³ This is a simple lemma holding for arbitrary groups. The security of the OTP is based on this, usually phrased in the language of the group $(\{0,1\}^n, \oplus)$.
